

What actions are TERRORIST cells and their leaders thinking about to
DO MAXIMUM DAMAGE to the UNITED STATES?

*as a citizen I am
concerned about the
anchors,
compressor plants ON
NG pipelines are
vulnerable points or
pump plants on oil
pipelines. what if
they cut at the
same time? too late
after it happens.*

Are the attacks on soft targets just diversions to get our attention off of what they really want to do?
A voice search on google about who originated & developed algebra disclosed it is a Latin word variants of
the Arab word al-jabre in 825 A.D. So Islamics are not dummies. Now, what would these terrorists do to
disrupt life as we know it in the United States of America? The answer is shutting down our use of electricity & NG
now and with no rockets delivering the punch! The production of electricity and it's transmission to our
cities, communities and industrial centers are vulnerable points. However, utility plants and their
transformers are now well or better protected. Oil and natural gas pipelines, water pipelines supplying
nuclear plants and power transmission lines often go through isolated areas not well protected. This is where
we would be hit, hit and hit.

You will notice no mention was made of electric plants that are fueled by coal! Coal at present prices
still produces electricity cheaper than \$2.00 natural gas. Plants utilizing this fuel usually have a 60 to 90 day
supply inventory, thank goodness, on location which means they are less susceptible to fuel disruptions than
natural gas plants. All three fueled plant types use water. Those wishing to harm the United States know this.
Terrorists have extensive experience blowing up pipelines, or compressor or pump plants on pipelines. What
would happen if this occurred in the winter during a widespread, severe cold snow storm?

The EPA's regulations in recent years on carbon emissions and the disastrous effects on the coal
mining industry and related service businesses make our country's electricity production much more
vulnerable to terrorist bombing attacks and electricity production disruptions. Is this good?

Imagine, in winter or not, if there were no lights, no gasoline or diesel pumping at service stations, no
power to run computers, no charging of I-phones and I-pads, no subway trains moving, hospital auxiliary
power units fuel exhausted with no regular electricity available, no oil refineries making fuel, no trains
running, no delivery trucks running, no food in the supermarkets, and no tap water, or natural gas to heat
homes.

Is the continuing emphasis on global warming and climate change also a diversion to keep our minds
off of thinking about our real problems that we need to be addressing. It's kind of like a military maneuver of
hitting them in the flanks or a beach landing back of their lines to cut the main force off. Are the diversions
a smart terrorist maneuver where the equation is going to equal their desired result?? Are they planning to
freeze the Americans in the cold, cold winter?
