Jellyfish are intriguing sea creatures which can be quite alluring to watch at aquariums, these creatures are harmless when confined to a fish tank but when you come into contact with one in its wild habitat such as the beach it can be a dangerous encounter. Jellyfish use their tentacles to sting, not to be a menace but to protect themselves from potential predators. Different species of jellyfish have different types of venoms, most of these venoms are painful and cause irritation, discomfort and some general feeling of being unwell. Make sure to keep an eye out when you are swimming in the ocean!
