I'm an archaeologist with the Savannah River Archaeological Research Program. I saw a Facebook post yesterday that shows what may be an articulated juvenile bison skeleton being dug up on a creek near the state park. It appears to be unfossilized and if it really is a bison it could be much more recent than the fossils typically found at Edisto. If it's Holocene in age it could be quite significant. We could have it radiocarbon dated if we could get a sample.

One of the family members indicated that her uncle made the discovery and often shares information on fossils he finds with the park rangers at Edisto??

I don't have any information on this, but please feel free to contact our park manager at Edisto Beach State Park, Jon Greider. He may be able to fill you in. His email is jgreider@scprt.com. Thanks!

Thanks. I have contacted the person who made the find and we are in the process of trying to have the bones identified as bison or modern domestic cow.
