

Lead Detection in Public Water Systems 2011 - 2015

Notes:

The Action Level for lead is greater than 15 parts per billion or .015 mg/L. The units for the lead values shown are in mg/L.

Monitoring periods are January through June and July through December. An exceedence of the action level is calculated based on the 90th percentile of all samples taken during the monitoring period (at different locations within the distribution system or multiple samples taken at the same location).

A blank means no sample was taken during that monitoring period. A zero means a sample was taken and lead was not found above the detection limit. A water system may be listed twice showing multiple samples in the same year.

There is no federal or state maximum contaminant level for lead. An exceedence of the action level requires the public water system to implement measures to control corrosion, provide education to their customers about ways to reduce exposure to lead in drinking water, and additional sampling.

Water systems typically sample for lead every 3 years, but may be on a shorter schedule if lead has been detected over the action level, or on a longer schedule if lead has not been detected (as noted).

No large systems (> 50,000 population) have exceeded the lead action level in the last 5 years. Of 28 exceedances, 24 are classified as small water systems (<3,300 population).
