I am a professor at a medical school. I have taught at three institutions (currently in my third). **I will not provide my exact credentials because several people who have tried to speak out against Hillary Clinton have been killed (look up "Clinton Body Count").** The Clintons have also ruined the lives of others who have spoken out, including Drew Pinsky. Drew Pinsky had his show canceled and received death threats, and Huffington Post writer David Seaman was terminated and is living in hiding for his columns about Hillary's health. Thanks for understanding the reason why I do not disclose my exact credentials.

Hillary Clinton might actually have 1 year to live based on medical records that were leaked indicating she has a disease called Subcortical Vascular Dementia. While many videos have been made about her health, all of them have missed the severity of her illness. She could die very soon, since Vascular Dementia is progressive and has a 3-5 year life expectancy. Clinton actually has a severe form of the disease that impacts the subcortex region of the brain, which includes the brainstem. This might explain why Clinton is dry-coughing so much. The brainstem controls primitive functions of the body like breathing, heart rate, and blood pressure. When there is ischemia to this region, B/P, HR, and breathing won't function correctly. Hillary's cough is so noticeable because she can't seem to get over it. Most people only need a couple of coughs and they are able to overcome what is in their throat. But not Hillary. Hillary has tried to explain that she has an "allergic cough." This is completely false and a lie. Based on her medical records, it is related to her Vascular Dementia, which she is dying of. She could rapidly decline if circulation is weak to the brainstem. I am very

concerned about Hillary, and if her VaD diagnosis is true, she would likely face increasing difficulties over the next few months.

Hillary's health record also states that she has "complex partial seizures." I have witnessed many people who have had seizures, and I believe Hillary is definitely showing signs of seizing activity. With complex partial seizures, one can show signs such as head nodding or lip smacking. Hillary, has had several instances where she appears to have had a seizure, the most well-known is when she was in front of a group of reporters. External, noxious stimuli can trigger seizing in certain individuals. Hillary had a seizure in front of the reporters. Not unsurprisingly, they are trying to control her seizures using a Diazepam autoinjector. Autoinjectors are used with urgent drugs such as Diazepam and Epinephrine in order to stop an life-threatening event from happening. If Hillary has seizures, they could cause an oxygen deficiency in the brain, resulting in damage and further progression of her VaD. An autoinjector is needed to control the seizure.

Many doctors are not speaking out about Hillary's health, but trust me, they are thinking about it and talking amongst themselves. If you specialize in neurosurgery, neurology, or neurovascular specialties as a doctor, no doubt it is quite obvious that Hillary has a big problem. She can barely walk up stairs and can't stand very long, has to hold on to side rails, etc. This makes sense, because she has VaD of the subcortex which involves the cerebellum (involved in controlling gross motor movements). Hillary, for the most part, can still deliver scripted speeches on green screens, so she still has some function. However, VaD will result in a rapid decline in function of the patient. VaD has a average life expectancy of 3-5 years (about 4 years according to the NHS). Hillary is entering into her final year of life since she was diagnosed with VaD in 2013. Why is she running for president if she is going to die soon? Does it have to do with Obama's Third Term?

Music: Beethoven's Symphony No.7 in A major op.92 - II, Allegretto
Ross Bugden "Flight Hymn"
