Hi, Chris! I'm not sure there is a "normal" with SC weather! :-) We've just started cooling off some this week, which is a little later than usual. I would say peak this year, if things continue as they are, will be sometimes the first full week of November. It looks like it is going to be later than usual. We're seeing very little color change, but since we've had some cool nights things should start to progress. Hope this helps!

Hi, I've been perusing your foliage reports and foliage articles and I called Table Rock SP who sent me to your web links (and I looked at the livestream). What is missing from ALL those resources, as far as I can tell is: what is the normal time that colors peak? I can't find a single place that it says "last week of October" or "some time between October 10 and November 20" or anything like that -only that right now, things are pretty green. I'd like to pick a weekend to head to the SC mountains and have a good chance of seeing color, and having some idea (in advance) what to expect would be very helpful.
