Subject: Tropical Update

Good Morning,

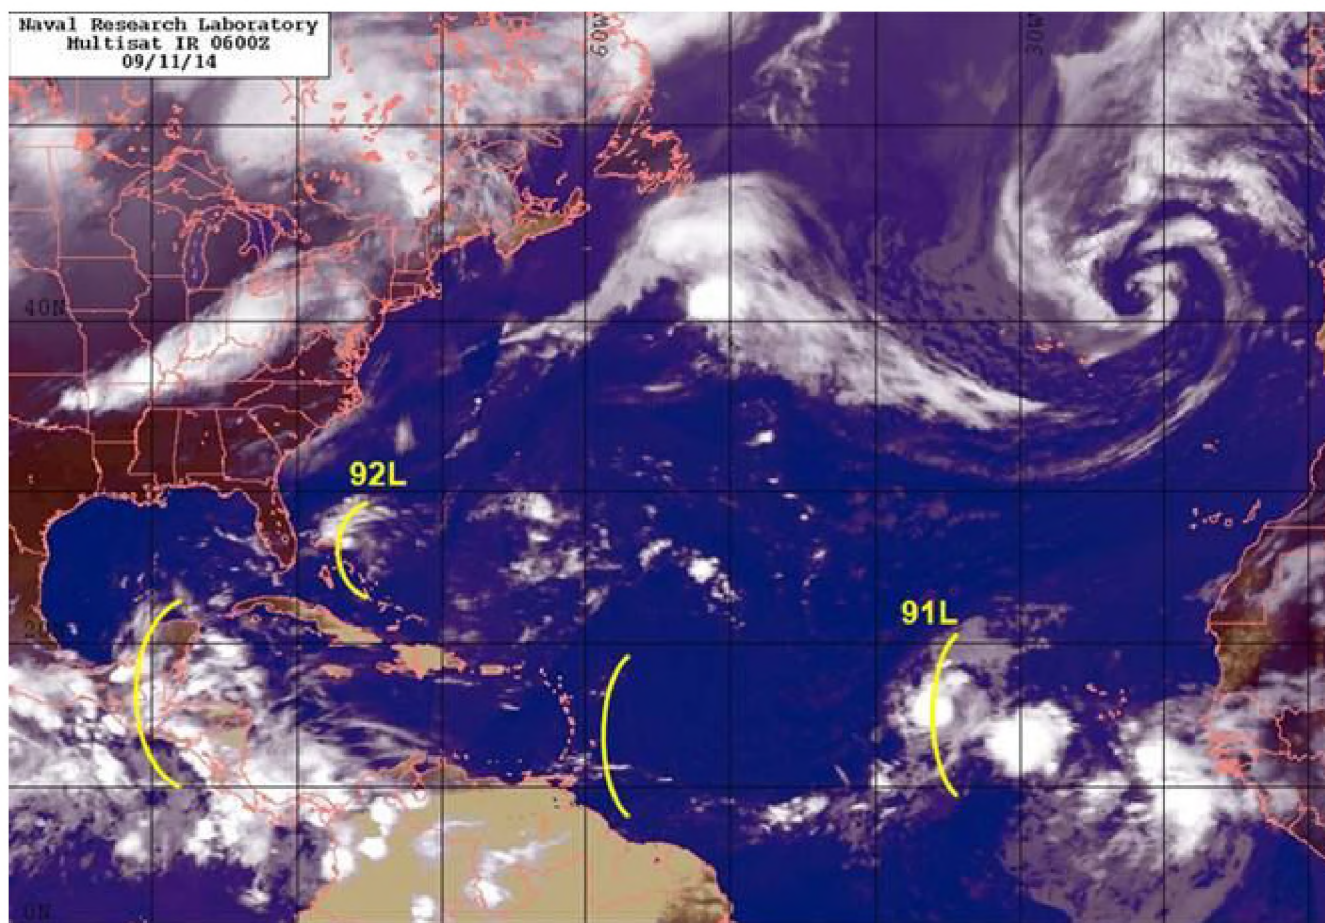

Slightly increased activity in the Tropics, yet nothing threatening this weekend. A persistent cloud feature over the Bahamas, now designated 92L, is a weakening area of low pressure forced by an upper level trough. This disorganized convection continues to weaken as it drifts west over Florida into the GoMex.

A weak wave east of the Lesser Antilles drifts into the Caribbean. No intensification is expected.

A well organized wave, 91L, near 15N, 035W, is drifting west-northwest at 15 mph with deepening convection and

hints of cloud banding. Slow intensification of 91L will continue this weekend becoming a depression or named storm as early as late Saturday. Models are and have been in excellent agreement taking 91L west-northwest for the next 72 hour before turning north early next week well east of 060W. The long range forecast keeps 91L over the Central Atlantic before merging with a frontal boundary in 7-10 days over cold Atlantic water.

Elsewhere over the GoMex, Caribbean and North Atlantic, tropical storm formation is not expected this weekend.

Mark Malsick
